POWER FOR YOUR SYSTEM

meth
GROUP

The logo consists of the word "meth" in a bold, white, sans-serif font. The letters are flanked by two thick, blue, horizontal bars that extend from the top and bottom of the letters respectively. Below "meth", the word "GROUP" is written in a smaller, blue, sans-serif font.

ELECTRIC TRANSFORMERS SINCE 1980

METH srl is designer and manufacturer of electric transformers since 1980 focusing on the quality of its product performance, thanks to decades of experience in this business. Since 1998 multiple national and international certifications are the result of a continuous effort in updating our products to meet worldwide standards and requirements.

METH is specialized in manufacturing LV single-phase transformers from 3,2VA to 800kVA, LV/LV three-phase transformers and auto-transformers from 100 VA to 2000 kVA, MV/LV three-phase transformers up to 3150 kVA and three-phase reactors for applications in different fields from industrial to automation to photovoltaic to marine.

Depending on the configuration, METH transformers bear the European or North American Approvals such as UL, KEMA and ENEC and Middle East Approvals (CoC - ex SASO). Meth experience and technology allow to develop and manufacture in a short time new products to meet any customers' requests and to improve new production programs.

QUALITY Meth Quality System, ISO 9001:2015 certified since 1998, rules all the processes: customers and suppliers orders management, preliminary controls, manufacturing cycles, final tests, handling of non conformity. As further confirmation of the constant quality-research over the years, Meth has obtained the following certifications:

- UL-CSA for single phase transformers up to 10 kVA and for three-phase transformers up to 800 kVA.

Meth is one of the few manufactures in Europe with UL-CSA LISTED certification.

- UL-CSA Insulation System class B-F-H.

- UL-CSA for three-phase transformers with approved box up to 500kVA.

- UL-CSA for three-phase auto-transformers with approved box up to 630kVA.

- ENEC-KEMA for single phase transformers up to 2 kVA.

Certification companies inspections are regularly scheduled, ensuring a constant quality level of the products.

PLANNING Meth obtains the transformers parameters that will be tested at the end of production, such as over-temperature, losses, performance, rigidity, insulation, induced voltage, ecc., using "RALE" calculation programs. During the calculation spacers and cooling channels are properly sized to assure a long and reliable service life.

PRODUCTION The entire manufacturing process is carried out internally: preliminary controls, automatic winding for small transformers and winding on machine for flat cable, copper or aluminium strip for bigger transformers, core-assembly and soaking or resin. At the end of production all transformers are tested internally with instruments according to ISO specifications and regularly calibrated in SIT centres.

TEST Meth transformers are 100% tested and test results are stored in Meth database and available on customers request. Meth test equipment allows to carry out all tests required by the standards. At the moment the equipment is available for the following tests: no-load losses, load losses, harmonic analysis, resistance, rigidity and insulation measurement, induced voltage, inrush current.

www.meth-group.com

Meth Kft is specialized in manufacturing **single-phase electric transformers and three-phase transformers from 30 VA to 100 kVA** for industrial and automation applications and **three-phase filter reactors**.

The Company is focused on the quality of product performance and deliveries in short time, empowered by the 30-year-experience gained in this business by Meth srl Italy.

Meth Kft performance is based on three statements which represent its core value: Technology and Customization, Dynamic Know-how and Cost Effectiveness. The production cycle refers to Meth srl Italy method and is based on three steps: planning, production, test.

DYNAMIC KNOW-HOW AND COST EFFECTIVENESS

Meth Kft is a dynamic and proactive company, focused on the quality of product performance and the optimization of delivery time. Thanks to technology efficiency and reduced cost line production Meth kft offers to own customers good products and competitive prices.

PLANNING All Meth Kft products are designed by technical dpt. using high-technology calculations programs like RALE for a proper evaluation of transformers electrical and technical features such as over-temperature, losses, performance, rigidity, insulation, induced voltage, dimensions and weight.

PRODUCTION The entire manufacturing process is carried out internally through a computerized production cycle. All the transformers are completely impregnated with resin. Preliminary check of raw materials and regular inspection of every single step during the production process are carried out to assure the best quality performance of the products.

TEST All Meth Kft transformers are tested internally at the end of the production process with routine tests. Test equipment allows to implement type tests required by the standards such as no-load losses, load losses, resistance, rigidity and insulation measurement, inrush current. Test results are stored in the Company database and available upon customer request.

FOCUS ON METH CERTIFICATIONS

Meth operates with a quality system in compliance with ISO 9001:2015 standards.

This means that all production processes follow different quality standards to improve efficiency and effectiveness in products development and manufacturing in order to have the highest customer satisfaction.

UL is one of several companies approved to perform safety testing by the US federal agency Occupational Safety and Health Administration (OSHA)

File: E169331

File: E215141

www.ul.com

CE marking is the manufacturer's declaration that the product meets the requirements of the applicable EC directives. The CE marking is a symbol of free marketability in the European Economic Area (Internal Market)

Coc Certification (ex SASO) allows the company to export in Saudi Arabia market, as the products passed strict technical test in a certified laboratory

ENEC-KEMA is an abbreviation for "European Norms Electrical Certification". It gives customers the assurance that a product has been certified by one of the national certification institutes in Europe and it complies with the relevant European safety standards

Which certifies the products compliance with marine standards

General data

Three-phase auto-transformers are electrical machine with one single common wiring where primary and secondary are not galvanically separated. They have smaller construction compared to the same isolating transformers. Typical applications are speed control for Fans, Starting of big three-phase Electric Motors, etc... Auto-transformers do not protect from earth failure. Their special feature is that the nearer are the values of the input and output voltage, the more cost-effective are auto-transformers. It is clear that auto-transformers should be calculated and designed every time, based on customer requests, since the input and output voltages are critical to determine the correct electrical sizing.

Construction in accordance with the following standards:

Standard

CEI-EN 61558; p. 2-13

UL5085 1-2 up to 630.000 VA

Certifications

File E169331 vol.1 sec. 2

The design rating power could be calculated by the following formula:

$$\text{Design rating} = P_{\text{nom}} \left(1 - \frac{V_1}{V_2} \right)$$

where:

P_{nom} = rated power (VA)

V_1 = lower voltage (V)

V_2 = higher voltage(V)

Example:

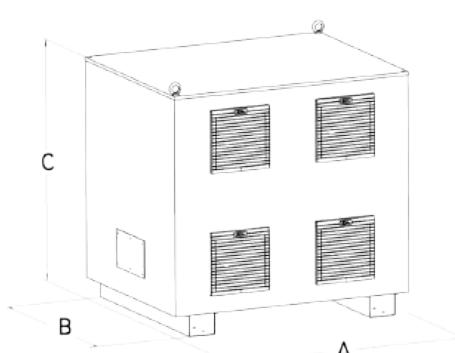

$P_{\text{nom}} = 100 \text{ kVA}$

$V_1 = 380 \text{ V}$

$V_2 = 480 \text{ V}$

$$\text{Design rating} = 100 \times \left(1 - \frac{380}{480} \right) = 21 \text{ kVA}$$

In this case technical data are referred to AT3TH-UL-20kVA

T3T up to 10 kVA

T3T 11-40 kVA

General data

Rated input voltage	100-600 V
Rated output voltage	24-600 V
Rated power	up to 25 k VA (safety transformers) up to 40 kVA (isolating transformers)
Insulation class	class F / H
Temperature class	class F / H

Ambient temperature	Ta=40°C
Protection degree	IP 00
Standard vector group	Dyn11 (others upon request)
Test voltage	4,2 KV/1'
Terminals	terminal blocks or bars

Application:

Three-phase transformers suitable for any industrial application where it is required the separation between the load and the net. Construction in accordance with the following standards:

Standard

- CEI-EN 61558; p. 2-4 – Isolating transformers
- CEI-EN 61558; p. 2-6 – Safety transformers
- IEC 61558; 2-4; 2-6

Upon request:

The transformers could be customized with:

- different voltages
- regulations
- taps on primary or secondary
- different enclosures
- wheels for movement
- vibration absorbers
- electrostatic screen between primary and secondary
- temperature control unit with 3PT100 probes inserted

T3T up to 80 kVA

T3T 81-2000 kVA

General data

Rated input voltage	up to 1000 V
Rated output voltage	up to 1000 V
Rated power	41 to 2000 kVA
Insulation class	class F / H
Temperature class	class F / H

Ambient temperature	Ta=40°C
Protection degree	IP 00
Standard vector group	Dyn11 (others upon request)
Test voltage	3 KV/1'
Terminals	terminal blocks or bars

Application:

Three-phase transformers suitable for any industrial application where it is required the isolation or voltage variation between the load and the net. Construction in accordance with the following standards:

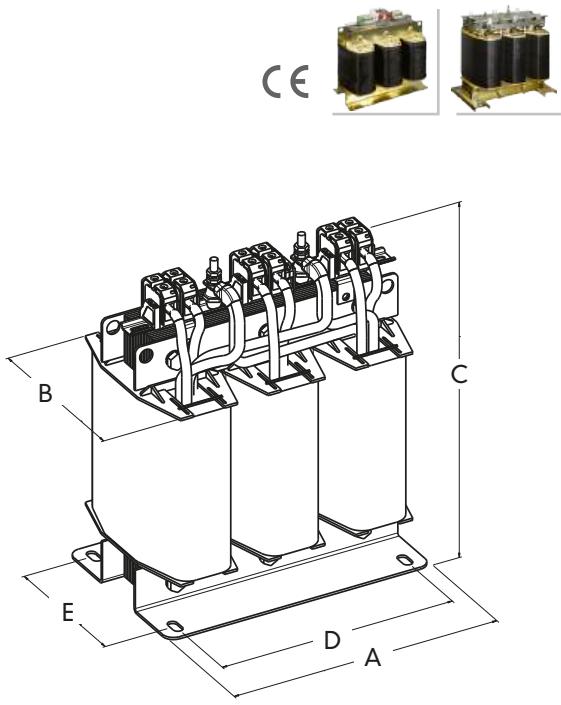

Standard

CEI-EN 60076
IEC 60076

Upon request:

The transformers could be customized with:

- different voltages
- regulations
- taps on primary or secondary
- different enclosures
- wheels for movement
- vibration absorbers
- electrostatic screen between primary and secondary
- temperature control unit with 3PT100 probes inserted

For higher powers technical and electrical data, please contact METH

General data

Rated input voltage	up to 1000 V
Rated output voltage	up to 1000 V
Rated power	10 to 300 kVA
Insulation class	class F-H
Temperature class	class F

Ambient temperature	T _a =40°C
Protection degree	with enclosure IP55
Standard vector group	Dyn11 (others upon request)
Test voltage	3 KV/1'
Terminals	terminal blocks or bars

Application:

Three-phase transformers suitable for any industrial application where the protection degree IP55 is required. The enclosure is pre-galvanized steel painted with polyester resin for external without fan ventilation. Construction in accordance with the following standards:

Standard

CEI-EN 60076

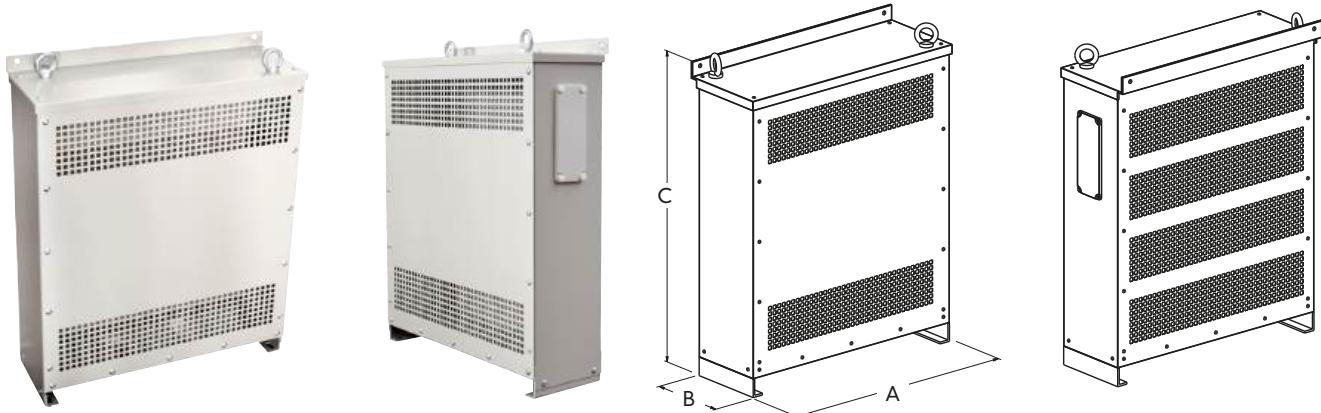

IEC 60076

ECO-DESIGN

General data

Standard input voltage	230 V
Standard output voltage	400 V
Rated power	from 6,3 to 30 kVA
Insulation class	class F-H
Temperature class	class B
Standard ambient temperature	T _a =40°C

Protection degree	IP20
Standard vector group	YNd11 (others upon request)
Inrush current	≤10 x I _n
Test voltage	4,2 KV/1'
Terminals	terminal blocks

Application:

Three-phase transformers designed for maximum utilization of the transformer design. They have very low losses and inrush current, high efficiency and very compact construction in order to save space and reduce energy consumption. Construction in accordance with the following standards:

Standard

EN 61558, p.2-4 and directive 2009/125/EC

Technical data T3SL

Standard Solution

Distribution Transformers:

Rated power	100 – 3150 kVA
Primary rated voltage	up to 36 kV
Secondary rated voltage	3 KV/1'
Terminals	up to 433V

Material of windings

Aluminium (Al)

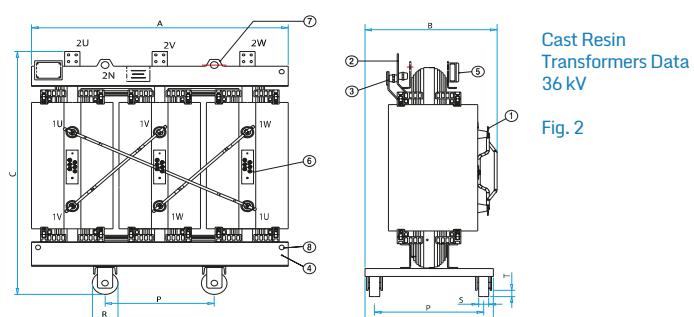

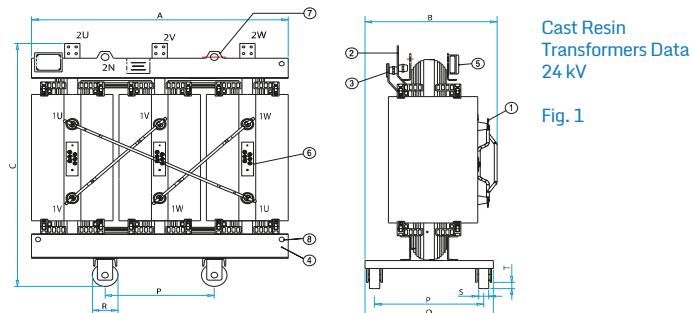

Equipment

Distribution Transformers:

HV terminals (n°3 pieces)
LV bar terminals (n°4 pieces)
Off load tapping links (n°3 pieces)
Rating plate (n°1 pieces)
Lifting lugs (n°4 pieces)
Earth terminals (n°2 pieces)
Orientable rollers (n°4 pieces)

Accessories (on request)

- Pt100 thermosensors with connection box
- PTC thermistors (as an alternative to the Pt100 thermosensors)
- Electronic unit for thermal control, with inputs for Pt100 and temperature display
- Electronic unit for thermal control, with inputs for PTC, without temperature display
- Forced ventilation systems (for temporary power increase)
- Electronic unit for ventilation system
- Transformer protective enclosure (degree protection IP23 & IP31)
- Surge arresters kit
- Antivibration pads
- HV terminals for plugin connections (Elastimold)
- Antiseismic frame (in base of level of earthquake)
- OLTC (OnLoad TapChangers)
- CT and VT instrument transformer

These devices help three-phase induction motors starting decreasing the supply voltage and the current. Once the starting is effective, the devices are switched off and the three-phase motor will work with net current.

Methi is manufacturer a wide range of single- and three-phase reactors.

MAIN APPLICATIONS OF REACTORS

R3F

THREE-PHASE PFC FILTER REACTORS

The insertion of capacitors banks in presence of harmonics causes a current absorption harmful for life time of capacitors.

Reactors connected in series with the capacitors guarantee:

- Reduction of harmonics
- Reduction of current and consequent reduction of capacitor overheating
- Increase of capacitors life time

R3L/M

THREE-PHASE SMOOTHING REACTORS FOR VARIABLE SPEED DRIVES (MOTOR SIDE)

Inverter Drives produce big quantity of harmful harmonics, which can damage of motor insulation and shorten its life time. Installing a choke between the drive and the motor allows to:

- Reduce the harmonics, improving waveform linearity
- Increase the life time of semiconductors
- Reduce the motor operating temperature
- Reduce the audible equipment noise
- Limit the short circuit current

R3L/R

THREE-PHASE SMOOTHING REACTORS FOR VARIABLE SPEED DRIVES (GRID SIDE)

Inverter Drives not only can damage the motor.

Harmonics can penetrate into the electrical net and cause some problems to other electronic or electrical equipment.

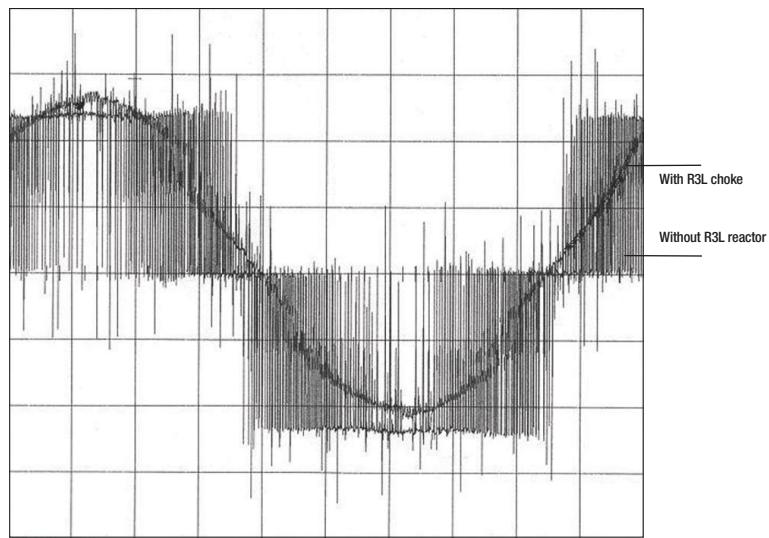

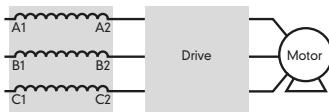

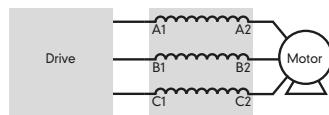

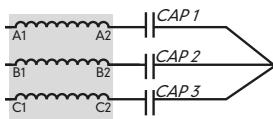

Installing a choke between the drive and the electrical net allows to:

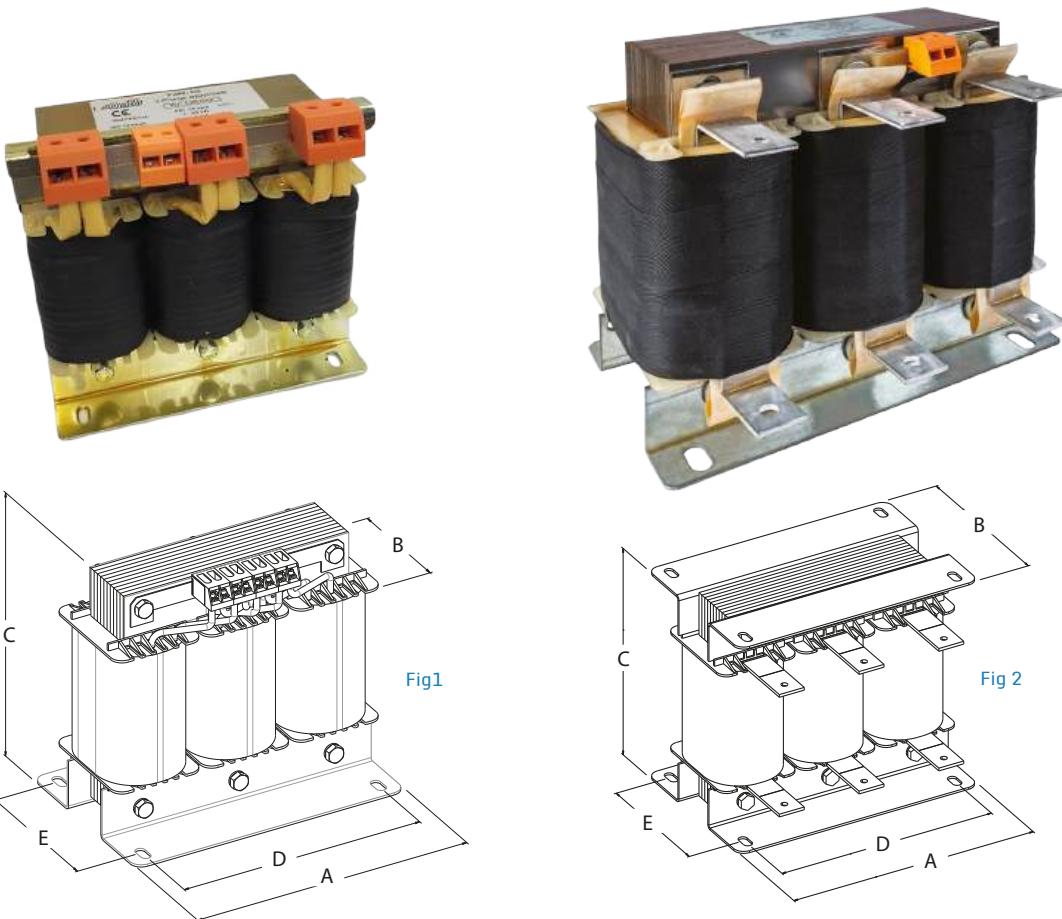

- Reduce the harmonics, improving waveform linearity
- Reduce interferences in the electrical net
- Increase the life time of semiconductors

REACTORS CONSTRUCTION AND MATERIALS

- Windings in copper wire class 200°C or Alluminium
- Magnetic cores from steel with reduced losses and necessary cuts.
- Double impregnation with Polyester resin for safety fixing and with oven dried varnish for protection against external agents.

- Terminals:
 - up to 20A with terminal board IP20
 - up to 90A, with lug terminals
 - over 90A with copper
- Insulation system approved by UL-CSA class F – File E215141
- EN 61558 , p.2-20
- IEC 61558
- UL 5085, p.1-2

SINGLE-PHASE TRANSFORMERS

meth-group.com

CoC certified products: T1ULF
For technical and electrical data see page 30

General data

Input voltage	T1Q : 200-440 V T1ULF-T1AL : 100-600 V
Output voltage	T1Q : 12-440 V T1ULF-T1AL : 12-600 V
	T1Q : 30-2000 VA
Rated power	T1ULF : 30-5000 VA T1AL : >5 KVA - 10 KVA

Insulation class	class F
Temperature class	T1Q : class B T1ULF-T1AL : class F
Ambient temperature	Ta=40°C
Protection degree	IP 00 - class I
Test voltage	4,2 KV/1'
Terminals	terminal blocks

Application:

Isolating transformer with secondary voltage > 50 V

Safety transformer with secondary voltage ≤ 50 V

They are suitable for any industrial/civil use for the electrical isolation of the input and output sides. Construction in accordance with the following standards:

Standard

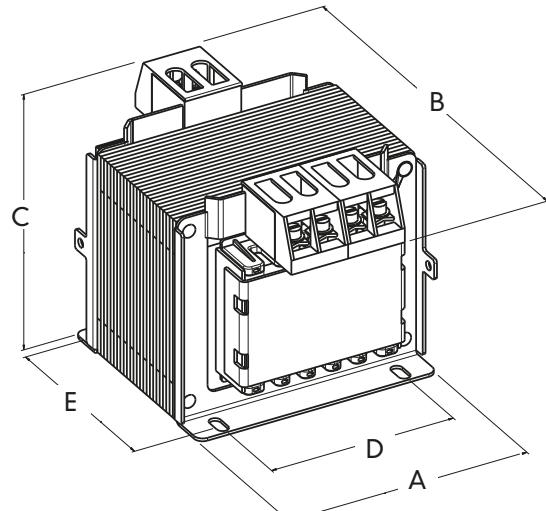

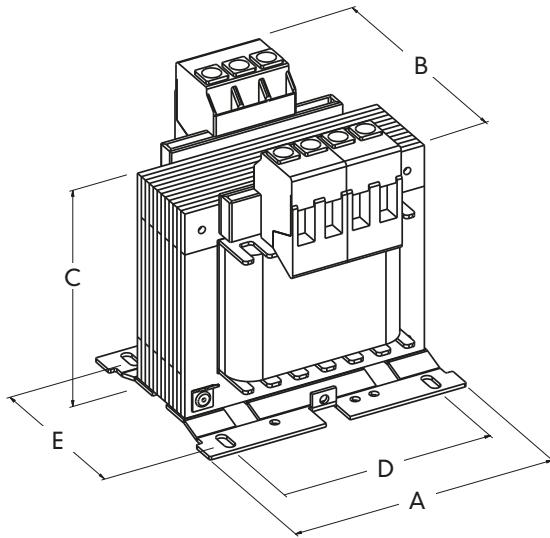

CEI-EN 61558,2-4 – isolating transformers
IEC 61558,2-4 – isolating transformers
UL 5085 1-2 – low-voltage transformers
CEI-EN 61558,2-6 – safety transformers
IEC 61558,2-6 – safety transformers
CSA 22.2, No66

T1Q: ENEC marked

T1ULF-T1UL: UL-CSA marked

General data

2 input voltage/1 output voltage output in two sides

Input voltage	230-400 V or others upon request
Output voltage	24 V/115 V or others upon request
Rated power	30-5000 VA
Insulation class	class F

Temperature class	class B
Ambient temperature	Ta=40°C
Protection degree	IP 00 - class I
Test voltage	4,2 KV/1'
Terminals	terminal blocks

Application:

Single-phase control, isolating and safety transformers designed combining reliable performance and cost-effectiveness.

They are completely impregnated with resin and have faston or screw earth connection, 4 sqmm terminal blocks, input and output in two sides.

Construction in accordance with the following standards:

Standard

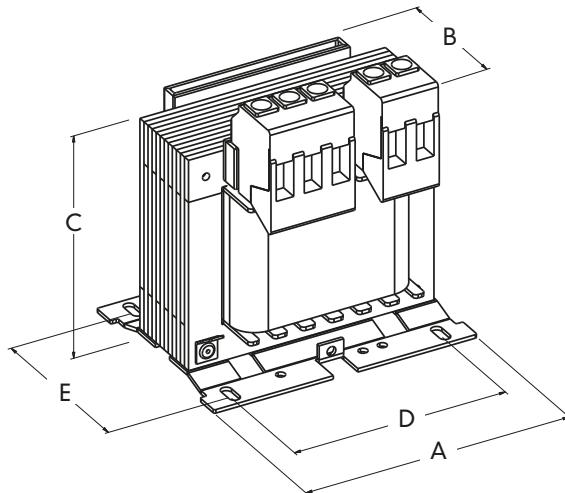

CEI-EN 61558,2-4 – isolating transformers

CEI-EN 61558,2-6 – safety transformers

IEC 61558,2-4 and 2-6

General data

Rated input voltage	230-400 V
Rated output voltage	12/24/48 V (others upon request)
Rated power	30-125 VA
Insulation class	class F
Temperature class	class B

Ambient temperature	Ta=40°C
Protection degree	IP 00 - class I
Test voltage	4,2 KV/1'
Terminals	Faston 6,3 sqmm

Application:

Single-phase isolating and safety transformers suitable for any industrial or civil use for the electrical isolation of the input and output sides with resettable switch on the output.

Construction in accordance with the following standards:

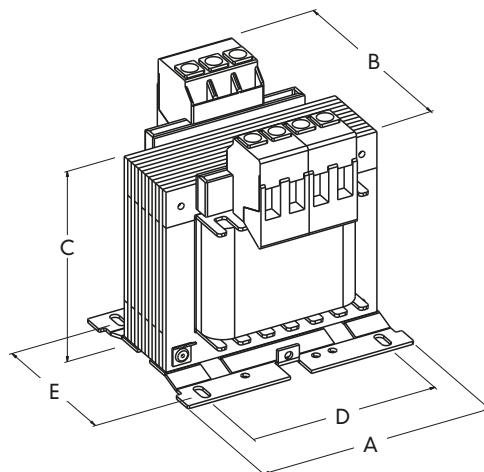

Standard

CEI-EN 61558,2-4 and 2-6 – isolating and safety transformers
IEC 61558,2-4 and 2-6

STANDARD WIRING DIAGRAM

Other configurations available upon request

General data

Rated input voltage	230-400±15 V
Rated output voltage	2X12 V or 2x115 V
Rated power	50-400 VA
Insulation class	class F
Temperature class	class B

Protection class	class II
Ambient temperature	Ta=40°C
Protection degree	IP 20
Test voltage	4,2 KV/1'
Terminals	self-lifting screws

Application:

Single-phase isolating and safety transformers suitable for DIN rail or floor screws installation.

Multi-voltage input and output with protection degree IP20.

Protection class II

Construction in accordance with the following standards:

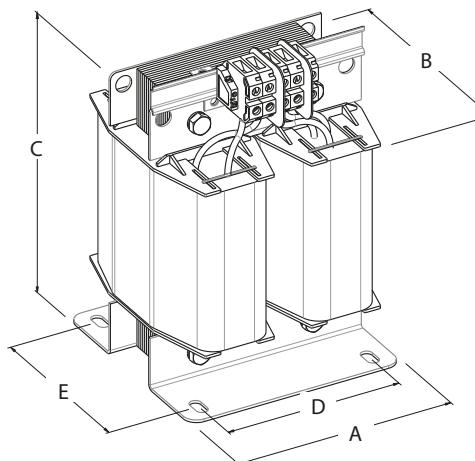

Standard

CEI-EN 61558,2-4 and 2-6 – isolating and safety transformers

IEC 61558,2-4 and 2-6

General data

Rated input voltage	up to 600 V
Rated output voltage	up to 600 V
Rated power	from 5 to 80 KVA
Insulation class	class H
Temperature class	class F

Ambient temperature	Ta=40°C
Protection degree	IP 00 - class I
Test voltage	3 KV/1'
Terminals	terminal blocks / bars

Application:

Suitable for any industrial applications for electrical isolation of the input and output side.

Construction in accordance with the following standards:

Standard

CEI-EN 60076 – dry type transformers
IEC -60076 – dry type transformers
UL 5085 1 and 2 – low voltage transformers

Certifications

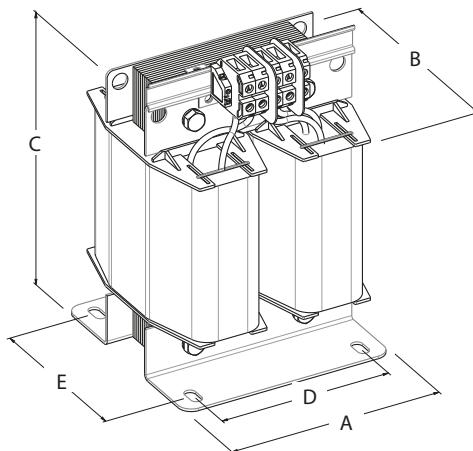

Insulation System class F - H (upon request)

Electrical data

General data

Rated input voltage	230 V
Rated output voltage	115-0-115 V
Rated power	from 2200 VA to 10kVA
Insulation class	class F-H
Temperature class	class B
Ambient temperature	Ta=40°C
Protection degree	IP 00 - class I
Inrush current	12 x In
Short-circuit voltage	3%

Insulation voltage	5KV/1'
No-load current	3%
Leakage current of the output winding to earth	≤0,5 mA
Leakage current of the enclosure to earth	≤ 3,5 mA
Terminals	terminal blocks
Double screen between primary and secondary	
Equipped with a pocket for PT100 upon request	

Application:

Suitable for galvanic separation between the net from the users in medical locations.

Construction in accordance with the following standards:

Standard

CEI-EN 61558, 2-15

IEC 61558, 2-15

Class F/F version is available upon request

Isolating transformer for powering medical locations.

transformers

Single-phase transformers
with fast-on terminals

MV three-phase reactors
for short-circuit current

Single-phase transformers
with vertical connectors

Single-phase
auto-transformers

Indications:

the following technical information are a guideline for the correct use of transformers in various voltage fields. The differences in the construction of the transformers are determined by the installation and equipment requirements. We summarize here the main definitions set down in EN 61558.1 and part 2 standard. Other standards which we refer to are: CEI 14-5, 14-8, EN 60076-1 (power transformers), UL 5085-1-2-3.

Transformers

Isolating transformer: suitable for limiting risks caused by contact between the earth and the live parts that can give an electric shock if the isolation is broken or damaged.

Primary voltage: 1000V max - Secondary voltage: max 500V no-load - Frequency: 500Hz max –Rated power: 25kVA if single-phase, max. 40kVA if three-phase. Type of isolating: double or reinforced.

Safety transformer: isolating transformer suitable for feed circuits of low safety voltage. Primary voltage: 1000V max - Secondary voltage: 50V max. no-load - frequency 500Hz – Rated power: 10kVA if single-phase , max. 16kVA if three-phase. Type of isolating: double or reinforced.

Rated Ambient Temperature:

this is the temperature surrounding the transformer. If not otherwise specified, the rated ambient temperature is 40 °C. Particular care should be taken when the temperature is higher. It should not exceed the values laid down in the table below. The core power must be adapted to approximately the values given below:

Rated Ambient Temperature	Rated power x factor
40 °C	1
50 °C	0.92
60 °C	0.84
70 °C	0.75

Over-temperature: this is the temperature which is verified in the transformer when it is working normally. In particular, in the windings, depending on the type of isolating materials and the rated ambient temperature, the following values must not be exceeded:

Maximum excessive temperatures for winding with ta=40 °C

A=60 °C - E=75 °C - B=80 °C - F=100 °C - H=125 °C

Rated Input Voltage:

network voltage feed of the transformer. Unless otherwise agreed, the maximum limit displayed is a value of 1.1 times the rated input voltage, as long as it does not cause damage to the continuous running of the transformer.

No-load Current: this is the input current of the no-load transformer with rated input voltage and frequency. The value of the no-load current is mainly effected by the properties of the used magnetic core laminations and can oscillate, even between transformers from the same production due to practical effects. An oscillation of - 10%/+20% with respect to the rated value is acceptable.

Protection Class:

the equipment has built-in safety to protect against dangerous electrical currents.

Class I: all the metallic parts accessible from the transformer are insulated from the voltage parts by basic insulation and added safety measures consisting of a safety conductor within the electrical system of the installation.

Class II: all the metallic parts accessible from the transformers are separated from the voltage parts with double or reinforced isolating. The transformer must not be connected to the earth.

Insulation Class:

Max insulation system temperature	Max temperature on winding with Ta=40°C
A (105 °C)	60 °C
E (120 °C)	75 °C
B (130 °C)	80 °C
F (155 °C)	100 °C
H (180 °C)	125 °C

Input Winding (Primary): particular attention should be paid if, rather than only one input voltage, additional voltage inputs are required. In this case an increase of the core power is necessary. For example:

Input voltage	Rated power x factor= scaling of the core power	
	1 section	2 sections
230	1	1
230+400	1.23	1.52
230+500	1.26	1.49
400+440	1.06	1.12
400+440+500	1.12	1.25

Rated Output Voltage: this is the output voltage of the transformer at rated frequency, rated input voltage, with a rated output current at a rated power factor (=1). This is obtained when the transformer is running in continuous service conditions with a rated ambient temperature. If not otherwise agreed, a tolerance of ±5% is acceptable. For short-circuit proof transformers it is ±10% for construction.

No-load Voltage: this is the secondary voltage of the transformer in no-load conditions, at primary voltage and rated frequency. This formula can be found starting from:

$$\text{voltage drop \%} = \frac{\text{No-load voltage} - \text{rated secondary voltage}}{\text{No-load voltage}} \times 100$$

EN 61558.1 standard gives the following values for isolation and safety of transformers:

Nominal % differences between secondary no-load and loaded voltage:		
up to 10 VA	100	
from 10VA to 25 VA	50	Note: for insulating transformers up to 63VA:20%
over 25 VA to 63 VA	20	
over 63 VA to 250 VA	15	For control transformers in accordance with EN 61558.1 part CEI 96-3 standard the max. difference is 10%
over 250 VA to 630 VA	10	
over 630 VA	5	

Output Winding: it means that in case of derivation output, the current is calculated in reference to the highest voltage, if not differently specified. In case of more windings, due to the quantity of isolation, it could be necessary to increase the core power.

Rated Power: this is the product of the rated secondary voltage for the rated secondary current. For three-phase transformers it is $\sqrt{3}$ times the product of the rated secondary voltage for the rated secondary current. For more secondary windings it is the sum of the product of rated secondary voltage for the rated secondary current of the circuits charged simultaneously.

Autotransformer: this is a transformer with common input and output windings, without galvanic isolation between the windings. The relative power is given by the formula:

$$P_{\text{app}} = P_{\text{nom}} \left(1 - \frac{V_1}{V_2}\right)$$

where P_{app} = power (VA)
 P_{nom} = rated power (VA)
 V_1 = lower voltage (V)
 V_2 = higher voltage (V)

Short Circuit Resistance: here is the classification that the standard EN 61558.1 applies to short circuit proof transformers:

a) **Transformer not inherently short-circuit proof:** this is a transformer in which has been designed to resist extreme temperatures using a external protective device not supplied with the transformer (e.g. external fuses).

b) **Short-circuit proof Transformer:** this is a transformer in which the over-temperature can not exceed the limits specified when the transformer is short circuited, and can function normally after the removal of the short circuit.

- **Transformer short-circuit proof with specific construction:** this is a transformer which comes with a protective device inside which opens the primary or secondary circuit or reduces the current in case of short circuit (e.g. PTC, bi-metal).

- **Transformer short-circuit proof not with specific construction:** this is a transformer which, in the absence of protective devices, in case of short circuit, does not exceed the temperature limits (e.g. small transformer with high internal resistance).

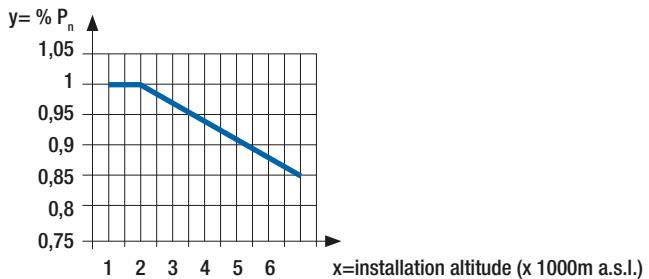

- **Fail-safe transformer:** this is a transformer which after abnormal use, stops working without placing the user at risk (e.g. transformer with thermo-fuse included).

De-rating Tables: the working conditions of rated power (P_n) are referred to the following parameters:

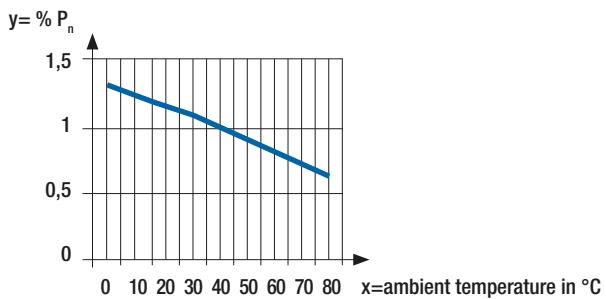

- Continuos service
- Frequency: 50Hz...60Hz
- Protection degree: IP00
- Installation up to 1000m a.s.l.
- Ambient temperature: $ta=40^{\circ}\text{C}$

Other conditions are allowed according to the following tables:

ALTITUDE:

AMBIENT TEMPERATURE:

Note: tables are in general. Upon request can be provided tables for the various types of transformers.

Intermittent Service: the required power could be calculated for different intermittent services starting from the following parameters:

- rated power (P_n)
- working time (T_{on})
- resting time (T_{off})

Intermittent rated power P_{int}

$$P_{int} = P_n \times \sqrt{\frac{T_{on}}{T_{on} + T_{off}}} \times 1,1$$

For example: rated load = 500VA

$T_{on} = 10'$

$T_{off} = 20'$

$$P_{int} = 500 \times \sqrt{\frac{10}{10+20}} \times 1,1$$

350VA transformer is enough.

Protection Devices: as general rule the transformer should be protected against short-circuits on the primary, against over-loads on the secondary. In both cases with delaying fuses (T) or with magneto-thermal switches with delayed tripping curve. Secondary protection calculation (against over-load) has not problems: EN 61558-1 standards provide a tolerance of $\pm 10\%$ on the rated secondary current and in any case on the external label it is indicated the fuse dimension. The primary protection calculation (against the short-circuit) is more difficult. It should be noted that a current peak (I_e) is generated at insertion moment which is 20-30 times I_n for about 10ms without protection that will occur in case of short-circuit.

It is necessary to know the short-circuit current, considering also the farthest point of the line transformer-user.

Known data:

V_2 = transformer output voltage

V_{cc} = short-circuit voltage in % (see catalogue)

P_n = transformer rated power

L = line length in meters

S = section of the conductor in m^2

$$I_{2cc} = \frac{V_2}{\frac{V_2^2 \times V_{cc}(\%)}{P_n \times 100} + \frac{0,036 \times L (\text{m})}{S (\text{mm}^2)}}$$

In general it is enough to consider a protection calculated as $1,5-2,5 \times I_n$ prim.

The table below is for single-phase transformers from 50VA to 1000VA with voltages 230-400/24V or 115V

Single-phase transformers - Protections with delaying fuses "T" serie

Protection against short-circuit

Pn	Input voltage		Output voltage		
	VA	230V	400V	24V	115V
50		0,50	0,315	2	0,40
75		0,80	0,40	3,15	0,63
